

Native Rabbit Phosphorylase Kinase

Cat. No. NATE-0559

Lot. No. (See product label)

Introduction

Description Phosphorylase kinase (PhK) is a serine/threonine-specific protein kinase which activates glycogen phosphorylase to release glucose-1-phosphate from glycogen. PhK phosphorylates glycogen phosphorylase at two serine residues, triggering a conformational shift which favors the more active glycogen phosphorylase "a" form over the less active glycogen phosphorylase b.

Applications Phosphorylase kinase from rabbit muscle has been used in a study to assess features of glycogen phosphorylase. It has also been used in a study to investigate the activation of different forms of muscle phosphorylase kinase by actin.

Synonyms Phosphorylase Kinase; dephosphophosphorylase kinase; glycogen phosphorylase kinase; PHK; phosphorylase b kinase; phosphorylase B kinase; phosphorylase kinase (phosphorylating); STK17; EC 2.7.11.19; EC 2.7.1.38; 9001-88-1

Product Information

Species Rabbit

Source Rabbit muscle

Form Lyophilized powder containing (NH₄)₂SO₄, sucrose, β-glycerophosphate and dithioerythritol

EC Number EC 2.7.1.38

CAS No. 9001-88-1

Activity > 60 units/mg protein

Unit Definition One unit will form 1.0 μmolar unit of phosphorylase a from phosphorylase b per min at pH 7.7 at 30°C in the presence of ATP.

Storage and Shipping Information

Storage -20°C
