

Immobilized Lipase B from *Candida antarctica*, Recombinant

Cat. No. NATE-1897

Lot. No. (See product label)

Introduction

Description Recombinant Lipase B from *Candida antarctica* (CALB) is produced by submerged fermentation with genetically modified *Pichia pastoris*. CALB can be used in the water phase or organic phase catalytic esterification, esterolysis, transesterification, ring opening polyester synthesis, aminolysis, hydrolysis of amides, acylation of amines and addition reaction. CALB is with high chiral selectivity and position selectivity, so it can be widely used in oil processing, food, medicine, cosmetic and other chemical industries. CALB is immobilized by physical adsorption on the highly hydrophobic resin that is a macroporous, styrene/methacrylate polymer.

Applications Immobilized CALB is suitable for applications in organic solvents and solvent-free systems, and can be recycled and reused for much times in suitable conditions.

Synonyms Lipase B; Immobilized Lipase B; Immobilized CALB; CALB; Immobilized Lipase; Immobilized; Lipase

Product Information

Species *Candida antarctica*

Source *Pichia pastoris*
