

Hydroxyacid Oxidase 1 from Human, Recombinant

Cat. No. NATE-3534

Lot. No. (See product label)

Introduction

Description Glycolate oxidase (HAO1) is a part of the superfamily of the alpha hydroxy acid oxidases (HAO) enzymes. HAO1 catalyses the FMN mediated oxidation of glycolate to glyoxylate and glyoxylate to oxalate by reducing oxygen to hydrogen peroxide. HAO1 is expressed mainly in the liver and pancreas and is most active on twocarbon substrates such as glycolate. HAO1 is the main cause of hyperoxaluria, a disorder in which large deposits of calcium oxalate form kidney stones.

Product Information

Species	Human
Source	E. coli
Form	Sterile filtered colorless solution
Molecular Weight	45.0kDa
Purity	>95%
Activity	> 3000 pmol/min/ug, and defined as the amount of enzyme that oxidize glyoxylate at pH 8.0 at 25C.

Storage and Shipping Information

Storage at -20°C
