

## Sialidase 33A from Bacteroides fragilis, Recombinant

Cat. No. NATE-1511

Lot. No. (See product label)

### Introduction

**Description** Neuraminidase enzymes are glycoside hydrolase enzymes (EC 3.2.1.18) that cleave the glycosidic linkages of neuraminic acids. Neuraminidase enzymes are a large family, found in a range of organisms. The best-known neuraminidase is the viral neuraminidase, a drug target for the prevention of the spread of influenza infection. The viral neuraminidases are frequently used as antigenic determinants found on the surface of the Influenza virus. Some variants of the influenza neuraminidase confer more virulence to the virus than others. Other homologs are found in mammalian cells, which have a range of functions. At least four mammalian sialidase homologs have been described in the human genome (see NEU1, NEU2, NEU3, NEU4).

**Synonyms** neuraminidase; sialidase;  $\alpha$ -neuraminidase; acetylneuraminidase; exo- $\alpha$ -sialidase; EC 3.2.1.18; 9001-67-6

### Product Information

**Species** Bacteroides fragilis

**Source** E. coli

**Form** 35 mM NaHepes buffer, pH 7.5, 750 mM NaCl, 200 mM imidazol, 3.5 mM CaCl<sub>2</sub>, 0.02% sodium azide and 25% (v/v) glycerol

**EC Number** EC 3.2.1.18

**CAS No.** 9001-67-6

**Purity** >90% as judged by SDS-PAGE

**Concentration** 0.25 mg/mL

**Specificity** Sialic acids from oligosaccharides, glycoproteins, glycolipids, colominic acid and synthetic substrates

### Storage and Shipping Information

**Storage** This enzyme is shipped at room temperature but should be stored at -20 °C.
